

Storm® Secure Wax Block

Rodenticide

Whole grain-based palatability, combined with the durability and securability of a compressed block

Storm® Secure Wax Block Rodenticide brings one of the most effective and powerful anticoagulant rodenticides to rat and mouse control. The high potency active ingredient in Storm Secure only takes a single feed for rodents to consume a lethal dose, providing fast and reliable control.

- Proven single-feed efficacy providing rapid control in any situation
- Excellent palatability promoting the rapid consumption of a lethal dose even in the presence of other attractive feeds
- Highly durable and securable block which can resist extreme temperatures, moisture and mould
- Central hole design enables secure anchoring and reduced risk of consumption by non-target species

We create chemistry

Storm® Secure Wax Block

Rodenticide

Storm Secure is formulated as a cracked cereal grain block with a low wax content, ensuring exceptional palatability and stability are maintained under hot and cold conditions. Storm Secure has also been developed using BASF's patented Fortec® Technology, ensuring feeding preferences for rats and mice are met in a single palatable formulation.

Storm Secure also contains a unique fungicide which minimises fungal growth in damp and humid environments. Whether developing a long-term baiting program or cleaning out a site from a severe infestation, Storm Secure provides an effective solution you can rely on.

SITUATION	PEST	REMARKS
In and around industrial, commercial, agricultural and domestic buildings.	Rats	Select suitable bait locations, such as within active rat holes, along runs and under rubbish. Try to establish a barrier of bait locations between living and feeding areas. Secure 3 or 4 Storm Secure blocks at each bait location on wire or nails, or inside rat bait boxes. Place 1 or 2 baits in each rat hole. Inspect the bait locations after 3 days and select new locations where there has been no take. Inspect again 4 days later and replace eaten blocks. Repeat bait station inspections at 7 day intervals, replacing fresh blocks only when blocks have been eaten, until all signs of rat activity have disappeared. Normally only 3 to 4 baiting rounds (pulses) are required.
	Mice	Mice have very limited home ranges and do not need to drink. They are more difficult to control than rats due to more erratic feeding patterns. Therefore selection of bait locations is even more important. Secure 1 or 2 Storm Secure blocks on wire or nails, or inside mouse bait boxes 2 metres apart in areas where activity is obvious, particularly where droppings are seen. In domestic premises, secure 1 to 2 blocks on wire or nails or in mouse bait boxes, in sheltered positions, inaccessible to children and pets, where mice are active such as under flooring, inside ceiling cavities, along pipe runs and conduits and behind skirting boards, furniture and appliances. Inspect bait locations and replace blocks as for rats until all signs of mouse activity have disappeared.

Refer to the product label for full directions and use table.

Packaging

3kg and 8kg buckets
