DON'T RISK IT. USE RACUMIN.

Whether it's on your farm, home or business, rodent control is an important part of protecting your animals and property. As the colder months come around, rats and mice are likely to move indoors. They spread disease and breed quickly. Rodents will damage your electrical wiring, chew building materials and cause destruction to agricultural crops by eating newly-sown seeds, young plants and seed heads on grain crops

There are some real benefits to knowing how best to manage your property in order to protect it from the potential ravages of rats and mice. The trick is, you need to familiarise the rodents with the bait stations and their positioning. The rodents have a phobia of anything new, so you need to make sure the stations stay in the same place – even moving the bait stations 100mm can cause shyness from the rodents from taking the bait again.

Rodents are eliminated quickly (3-8 days) with Racumin.

- Low risk of secondary poisoning
- Highly palatable – no bait shyness
- Suitable for indoor and outdoor use
- Blocks and tracking powder registered for the use in macadamia, sugar cane and pineapple plantations
- Contains Bitrex – a human taste deterrent
